This week, I have been writing code and fixing specific features in our game. It feels good, since I during last reflection expressed my willingness to be more involved in the code. Next week, I hope to be able to code more in pairs, since I got stuck on an issue already this Monday which I still don't have managed to solve.

Accordingly, I increased my understandning of how long time different coding tasks take, but also how dependent you are on what everyone else have done and does work on currently.

Next week I want to better understand how to communicate around structural/architectial concerns in the code to better contribute with more code development.
